Dear Director Fink,

Thank you for taking the time to respond and your efforts for Miami drinking water. My background is as an environmental attorney with significant experience in PFAS chemicals and str that seem to be not addressed for which there are simple and immediately solutions:

(1) According to the EPA, any level above .004 PFOA and .02 PFOS are dangerous and cancer causing. The Miami drinking water levels are around 30 ppt according to the latest water

Sewer Department (WASD)'s outreach efforts to communicate the excellent level of our drinking water,") and that the water is safe (e.g. "To ensure the safety of your water, WASD routinely

Here the EPA states the dangers of PFAS chemicals in drinking water including but not limited to the following:

<https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas>

"What We Know about Health Effects

Current peer-reviewed scientific studies have shown that exposure to certain levels of PFAS may lead to:

- Reproductive effects such as decreased fertility or increased high blood pressure in pregnant women.
- Developmental effects or delays in children, including low birth weight, accelerated puberty, bone variations, or behavioral changes.
- Increased risk of some cancers, including prostate, kidney, and testicular cancers.
- Reduced ability of the body's immune system to fight infections, including reduced vaccine response.
- Interference with the body's natural hormones.
- Increased cholesterol levels and/or risk of obesity."

"Children

Because children are still developing, they may be more sensitive to the harmful effects of chemicals such as PFAS. They can also be exposed more than adults because:

Children drink more water, eat more food, and breathe more air per pound of body weight than adults, which can increase their exposure to PFAS."

(2) The wells to the west of the airport are more than 10x less contaminated and have been for years, yet the water from in and around the airport continues to be served to children, schools. PFAS levels between 0 - 2 ppt. Because the groundwater flows west to east, and the PFAS contamination is from the MIA airport, these wells to the west are exponentially cleaner and safer.

(3) The public should be notified immediately that this water is NOT safe and excellent, with priority to children and pregnant women (e.g. schools, hospitals, high risk areas, etc.) AND that the water is not safe to drink.

Most notably, the county owns the airport and the water supply. The county contaminated the water supply via AFFF (fire fighting foam) and serves water to the population at levels that are not safe to drink.

Notably, in the multi district litigation against 3M, DuPont and other producers of PFAS chemicals (for which Miami Dade county is seeking appx \$200 million from) it is likely that financial interests are excellent and safe yet at the same time knows that there are significant problems such that it is pursuing \$200 million from the litigation.

I am eager to resolve this matter expeditiously and can provide significant support in doing so. I am reaching out as a concerned citizen with significant expertise on the matter. Contact me at 305-413-8163 or donatelo.rigano@gmail.com

Mr. Donatelo,

Good afternoon. The Miami-Dade Water and Sewer Department (WASD) is committed to its mission to safeguard public health by providing high-quality drinking water to more than 2.6 million people.

As one of the largest water and sewer utilities in the Southeastern United States, it is imperative that WASD stays abreast of evolving regulatory changes, industry trends, and best practices to ensure the safety and quality of our drinking water.

The Department is actively working to reduce PFAS through a multi-pronged approach by identifying and eliminating sources of contamination; implementing processes to mitigate PFAS and the private sector to collaborate on delivering PFAS compliance solutions that are both appropriate and economically feasible for the utility.

WASD has completed bench testing of multiple potential treatment technologies, including granular activated carbon, reverse osmosis, nanofiltration, ion exchange, and direct wellhead treatment.

While addressing PFAS will require significant investment, the County is pursuing litigation recoveries and funding opportunities at the local, state, and federal levels to help offset cost.

This project represents Miami-Dade's commitment to protecting public health, preserving drinking water sources, and staying ahead of emerging contaminants. Through smart investment and innovation, we are committed to providing safe, clean drinking water for all.

I hope you find this information useful. If I can be of further service, please let me know.

Sincerely,

Jay J. Fink, P.E., Director
